HERBAL HORMONAL REPLACEMENT THERAPY

When it comes to natural alternatives for hormone replacement therapy (HRT), often evidence supporting their effectiveness is still lacking. In that respect, the efficacy and the safeties' of Vitac's product (Warmi®) are scientifically proven. As a HHRT, Warmi ® has been evaluated in preclinical and clinical studies and the results demonstrated that Warmi® not only relieving the symptoms associated with menopause and thus improving quality of women's life.

It's also comparatively safer and free from undesirable side effects, usually associated with available marketed and popular HRT. Warmi® is comprised of a patent-pending blend of vegetable and fruit extracts that are 85% organic and 100% vegetarian. These extracts are rich in nutrients such as glucosinates, beta-sitosterol and hesperidin.

A LIFE CHANGING PRODUCT

CLINICAL STUDIES

PRECLINICAL

STUDY 1

was conducted in a murine menopausal model to demonstrate beneficial effect of Warmi® and compared with placebo effect, by preventing body and uterine weight gain, and decreasing triglyceride and total cholesterol levels.

CLINICAL

STUDY 2

Was a Phase-1, double-blinded, placebo-controlled, randomized clinical trial (RCT). Number of subjects was 60 women and study duration was for 3 months.

This Phase-1 study results confirmed that the daily consumption of Warmi® was safe and tolerable in healthy adult women. Moreover, no negative effect either on menstrual cycles, or on serum hormonal profile (Estradiol, LH, FSH and progesterone), or on body mass index, or on blood pressure values was observed.

STUDY 3

was a **Phase-2** single blinded, three-armed controlled, randomized clinical trial against available marketed popular HRT (i.e., Tibolone®). This **Phase-2** study concluded that the decrease of baseline menopausal symptoms (MENQOL) after three months of treatment was significant in all three groups (two doses of Warmi® (low & high) and marketed HRT) without difference between the groups. Number of subjects in this study was 60 women and the study duration was also for 3 months.

STUDY 4

was a double-blinded randomized clinical trial, comparing Warmi® against available marketed popular HRT (i.e., Tibolone®) and placebo. Number of subjects was 60 women and duration of the study was again 3 months.

STUDY 5

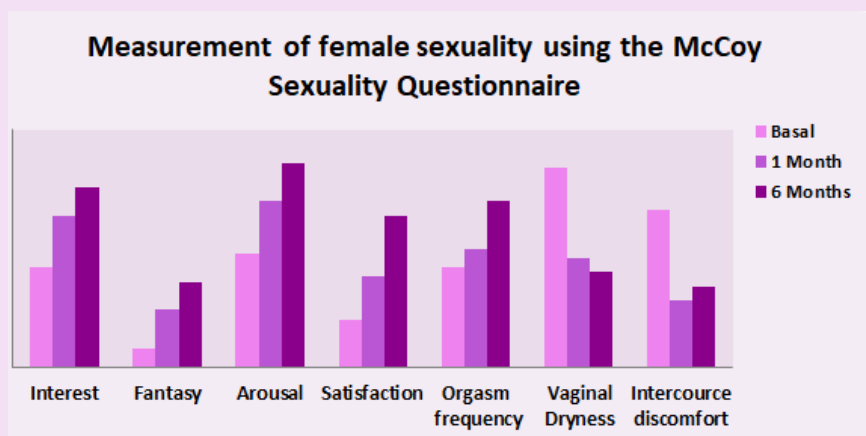

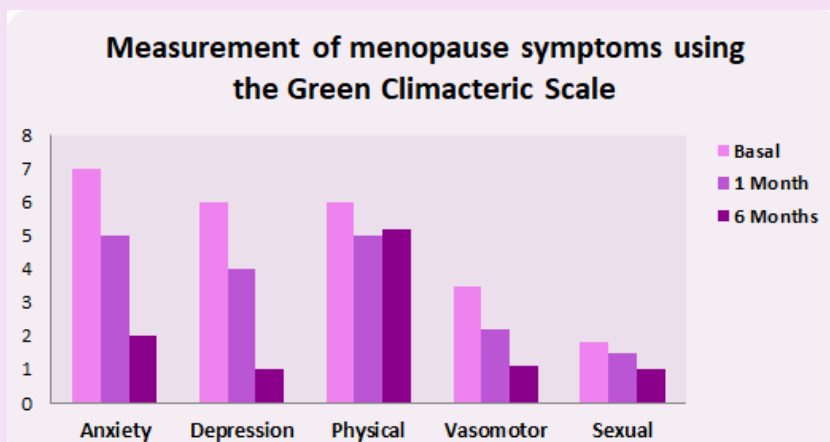

was a double-blinded randomized clinical trial, comparing Warmi® against available marketed popular HRT (i.e., Tibolone®) and Isoflavones. Number of subjects was 60 women, duration of study was again 3 months..

Both the studies (# 4 & #5) results consistently found that oral administration of Warmi® for six months significantly improved levels of total blood cholesterol (decreased), LDL (decreased), HDL (increased), estradiol, and IL-6. In addition, the RCT study which compared Warmi® against Tibolone® and Placebo found significant improvements in the LDL/HDL ratio and levels of osteocalcin and IL-8, as well as the alleviation of all common menopausal (as per Green Climacteric Scale) and sexuality symptoms (as per McCoy Scale).

SIGNIFICANT IMPROVEMENT BASELINE FOR SEVERAL SYMPTOMS WAS NOTED AT THE FIRST MEASUREMENT PERIOD (1 MONTH)

Improvement to placebo was noted at 3 months and generally improved thereafter

Activity: A study of 122 women experiencing moderate to intense menopausal symptoms found that Warmi® significantly improved in changing mood (2 different measures), vasomotor (hot flashes/night sweats) symptoms and sexuality compared to baseline values. Sexual improvement included sexual fantasy, arousal, satisfaction, intercourse discomfort, orgasm frequency and vaginal dryness. Compared to baseline, Warmi® also improved somatic (sleep) measures at months 1 and 3 and quality of life measures (physical health, psychological, social relationships, general) at 6 months study period. Finally, cardiovascular, bone resorption and other hormonal balance markers statistically significant improvement was also observed, over baseline at 6 months in that study
